

Artificial Intelligence 1

Prof. Dr. Frank Hopfgartner
Dr. Matthias Horbach

Institute for Web Science and Technologies (WeST)
University of Koblenz

Overview

- 1 Introduction
- 2 Classical logics and Prolog
- 3 Search and automatic planning
- 4 Knowledge representation and reasoning
- 5 Agents and multi agent systems
- 6 Summary and conclusion**

Chapter 1: Summary

- ▶ What is “Artificial Intelligence?”
- ▶ History of AI = History of Computer Science
- ▶ Humans and rationality
- ▶ Strong and weak AI hypothesis
- ▶ Turing test, the Chinese room, Winograd schemes
- ▶ AI has many facets

Chapter 2.1: Summary

- ▶ Syntax and semantics of formal logics
- ▶ Propositional logic
 - ▶ Syntax: signature, \wedge , \vee , \neg
 - ▶ Semantics: interpretations, models, satisfaction relation
 - ▶ Inference, equivalence
 - ▶ Satisfiability, CNF, SAT
- ▶ First-order logic
 - ▶ Syntax: signature, variables, terms, atoms, \wedge , \vee , \neg , \forall , \exists
 - ▶ Semantics: interpretations, variable assignments, models, satisfaction relation
 - ▶ Automatic theorem proving

Chapter 2.2: Summary

- ▶ First-order logic and Horn logic
- ▶ Prolog programs
 - ▶ data base D
 - ▶ rule base R
- ▶ Prolog interpreter SWI-Prolog
- ▶ Lists and list operations
- ▶ Cut operator, text output

Chapter 3.1: Summary

- ▶ Uninformed Search: we have no further information besides the state transition relation
- ▶ General strategy: extend paths incrementally starting from the start node
- ▶ Search strategies
 - ▶ Depth-first search
 - ▶ Breadth-first search
 - ▶ Iterative depth-first search
 - ▶ Bidirectional search

Chapter 3.2: Summary

- ▶ Idea of informed search: “guess well” the next best state
- ▶ Use heuristics to evaluate states
 - ▶ Admissible heuristics
 - ▶ Dominance
- ▶ Algorithms
 - ▶ Greedy best-first search
 - ▶ A*

- ▶ Situation calculus
 - ▶ Situations \neq states
 - ▶ Fluents: situation-dependent relations
 - ▶ Actions: preconditions and effects
- ▶ STRIPS
 - ▶ Simple planning language
 - ▶ Actions are triples (C, D, A)
 - ▶ Simple depth-first search algorithm r-strips

Chapter 4.1: Summary

- ▶ Default rules of the form

$$\delta = \frac{\phi : \psi_1, \dots, \psi_n}{\chi}$$

represent plausible (but not necessarily generally valid) rules

- ▶ Extensions: deductively closed, include facts, closed under default application
- ▶ Fix point characterisation of extensions
- ▶ Computing extensions with process trees
- ▶ Normal default theories and semi-monotony

Chapter 4.2: Summary

- ▶ extended logic programs contain rules of the form

$$r : \quad H \leftarrow A_1, \dots, A_n, \text{not } B_1, \dots, \text{not } B_m.$$

- ▶ grounding of first-order rules
- ▶ states, closed states
- ▶ minimal models of programs without default negation
- ▶ Gelfond-Lifschitz-Reduct and answer sets
- ▶ Answer sets and default extensions

Chapter 4.3: Summary

- ▶ Abstract argumentation frameworks $AF = (Arg, R)$
- ▶ Conflict-freeness, defense, admissibility
- ▶ Characteristic function
- ▶ Semantics
 - ▶ Preferred semantics
 - ▶ Grounded semantics
 - ▶ Complete semantics
 - ▶ Stable semantics

Chapter 5.1: Summary

- ▶ A simple agent model of a reflex-based agent is realised through a function $act : P \rightarrow A$
- ▶ Model-based agent with functions

$$upd : P \times M \rightarrow M \qquad act : M \rightarrow A$$

- ▶ The BDI model: *Beliefs, Desires, Intentions*
 - ▶ Deliberation and means-end reasoning
 - ▶ Realised through the functions *brf*, *options*, *filter*, *plan*, *execute*
 - ▶ Self-commitment towards intentions and plans
